

# HuveGel® Complementary feed

## Practical guidelines for HuveGel® preparation

Use one package of HuveGel® to prepare 5 litres of gel solution

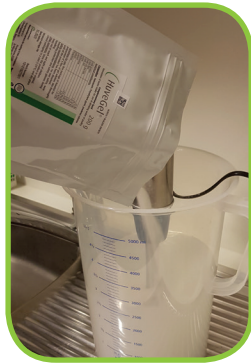

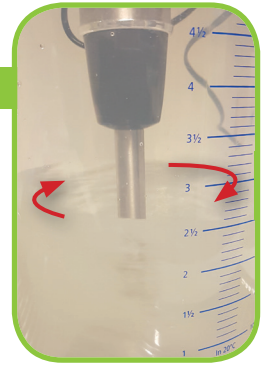

### Step 1

Using tap water, add 2 litres of water in a 5 litres container to start preparing the gel.

### Step 2

Apply an electric mixer to create a whirlpool in the water.

### Step 3

Gradually add the gel powder (one full sachet of HuveGel®) to the whirlpool, whilst continuing to mix.

### Step 4

Continue mixing for at least one minute, until the gel is completely dissolved.

### Step 5

Gradually add the remaining 3 litres of water to the solution, whilst mixing continuously, reaching a final volume of 5 litres of gel solution.

### Step 6

If required, add a colouring agent (for instance Brilliant Blue) to the solution.

### Step 7

The gel solution is ready for use in an appropriate spraying device.
